ABSTRACT

A process and apparatus for producing a sterile milk product from raw milk is disclosed. After separation, the skim milk portion is conducted to a primary filter assembly having a plurality of microfiltration units arranged in series. Bacteria having a size larger than the pores in the microfilters are retained in the retentate. The retentate is discharged from the primary filter assembly and flows to a secondary filter assembly having a plurality of microfiltration units. The permeate from the units in the primary filter assembly are combined and subjected to heat treatment.
